Seven Steps to Nighttime Dryness, Second Edition, provides the newest updated information and tips to help your child get to nighttime dryness. Renee Mercer, a pediatric nurse practitioner, provides guidance based on her

experience with helping thousands of children become dry at night. In this easy-to-read book, she answers common questions such as "Did I do something to cause this problem?", "How long until my child outgrows

bedwetting?", "Will my child ever be able to go to a sleepover without worrying?", and "What can I do to speed up this process?" This book is a must-read for any parent with a child who is struggling to get to nighttime dryness.

Integrative Medicine for Children

Elimination disorders, specifically enuresis and encopresis, affect millions of children worldwide. Management of this problem is often a source of frustration for parents, especially as their children reach school age and beyond.

For clinicians, having a good understanding of both the physical and behavioral factors that contribute to these problems is essential if they are to be successfully treated. This volume will walk clinicians through the physical, behavioral, and emotional factors that contribute to the development of these disorders and, most importantly, provide evidence-based interventions that will result in the effective treatment and elimination of these common clinical problems. Thus, this book will serve as a resource for clinicians to not only explain the etiology of enuresis and encopresis, but more importantly to provide clinically proven interventions that have been demonstrated to treat these disorders successfully.

Nocturnal Enuresis

The child’s role in treatment has until recently been neglected, with only the clinician’s and parents’ views being seriously considered. Recent work has demonstrated that the child’s contribution is essential in designing effective intervention.

Nocturnal Enuresis

Evidence-based Urology

This book is an excellent resource for Chinese Medical practitioners interested in including paediatrics in their practice. It is built around numerous Chinese studies on the treatment of enuresis, enabling the reader to view and treat the problem from various perspectives. How to put all this knowledge into practice is demonstrated in quite a few well-structured case histories. An introductory section on the Western view on pathology and treatment of bed-wetting offers the most up-to-date information in an easily readable format. This book takes the integration of Western and Chinese medical approaches one step further. Through the use of some of the recommended treatments offered in this compassionate and thoughtful book, the practitioner will discover just how rapid and successful TCM can be in treating this difficult (for parents as well as the child) condition.

Nocturnal Enuresis

Lower urinary tract dysfunction (LUTD) is an umbrella diagnosis that covers the abnormalities of anatomy and function in the bladder, urethra, and, in men, the prostate. People with LUTD face a number of social, mental, and physical health effects due to the symptoms. Despite the increasing evidence in the assessment and management of lower urinary tract symptoms, it remains a challenge to bridge the gap between research evidence and clinical practice. In this book, each and every one of the authors presents a remarkable work for how to apply evidence to clinical practice from different aspects. I hope this book is a key for every reader to open the door to LUTD.

Nocturnal Enuresis

Background and Aims: Bedwetting is the most common childhood complaint and is important to ask children and their parents about nocturnal incontinence during health visit at 5 years of age. Aim was to analyze patients with primary nocturnal enuresis (PNE) in our pediatric practice.

Methods: We collected electronic data of children 5 years of age, descriptive statistical analysis was used. Results: Out of 100 patients 5 years of age 7 had PNE (7%), 5 boys, 2 girls. In only 2 cases parents referred the problem themselves during regular health visit, in all other cases only when asked if the child had bedwetting. Two children (28.6%) had both enuretic parents, 4 children (57.1%) had 1 enuretic parent (father in all cases) and 1 child had no family history of PNE. Pediatric and neurological exam and blood pressure were normal in all children. All patients had normal urin analysis and normal ultrasound of the urinary system. Parents were advised to keep voiding diaries. All patients had nocturnal polyuria. Five patients (71.4%) were administered Desmopressin acetate (Minirin 120ug) for 3 months with no relapse. Two patients (28.6%) were recommended alarm devices.

Conclusion: It is important to address and treat PNE because if unrecognized the problem worsens and can result in emotional stress.

Nocturnal Enuresis

A compact, "how-to" manual on effective, evidence-based treatments for enuresis and encopresis. The aim of this book is to provide readers with a practical overview of the definitions, characteristics, theories and models, diagnostic and treatment recommendations, and relevant aspects and methods of evidence-based psychosocial treatments for encopresis and enuresis, primarily in children. Although treatments and research for elimination disorders are reviewed in general, particular attention is directed at constipation and encopresis, tailoring reflux, and diurnal and nocturnal enuresis due to the high incidence of these conditions in children. Case vignettes, websites, and suggestions for further reading are provided for the interested reader.

Nocturnal Enuresis and Incontinence of Urine

A positive, interactive plan for overcoming bedwetting, geared to parents of kids ages 6-13. Author Dr. Howard Bennett is both a pediatrician and a parent, and he encourages parents to read the book together with their children and develop a plan that includes behavior management techniques, calendars, contracts, and bedwetting alarms.

Nocturnal Enuresis

Except from Nocturnal Enuresis and Incontinence of Urine The list might be greatly extended. But such are a few of the causes which have been noticed as giving rise to it. It is evident, therefore, that it is futile to prescribe any routine course of treatment until a careful study of each case is made, and the point of origin of the disease determined. To the removal of that exciting cause the treatment should be at once directed. The enuresis being but a consequent or secondary pathological condition. Would be a matter for subsequent consideration. In planning over the bird's causes, it appears as if, in some cases, the attention of the parents is not sufficiently directed, viz: Atony or paralysis of the bladder itself, permitting over distension and resulting in stillicidium. The Complete Bedwetting Book

Scandinavian Journal of Urology and Nephrology

Nocturnal Enuresis and Daytime Wetting

A comprehensive review of enuresis, such as this, has long been overdue. In this book attention is given to bladder control, reflecting current interest in developmental aspects of paediatrics, and to enuresis, reflecting the need to relieve a common cause of unhappiness.

The topics discussed include how most children become dry by age four or five, and why a minority do not; why these children go on wetting their beds, and why some start doing so after a period of dryness. The prevalence of bedwetting in younger children varies curiously in different countries. Treatment, by explanation, by drugs and by the buzzer, is well covered in practical detail.

Previously published articles are reviewed. In too many cases it has been difficult to determine whether authors are consistently writing about day-time or night-time. Life-long or acquired, wetting. Emphasis is given to papers in which soundly based research is clearly reported. Though this book was inspired and derives from a recent International Colloquium at Newcastle, it is anything but a report of that Colloquium. To extend coverage and avoid repetition, a number of chapters have been specially written, and papers have been re-written, fused or omitted; several up-to-date, comprehensive and authoritative reviews have been included. Whether readers are community, hospital or family doctors, or psychologists, they can enjoy criticizing and evaluating the all the differing views put forward, and can synthesise their own new and better conclusions. The editors have aimed to clear the way for further research by identifying clearly what is known and posing questions. Equally, however, it is hoped that this volume will promote a deeper and better understanding of bladder control and enuresis, and enable doctors who use it for reference to give more effective help to children with wetting problems.
